

# User-visible error rate under bounded retry

SmallBank, PostgreSQL, MPL = 64, hotspot  $p = 0.9$ ; mean over 5 repeats

| Policy       | N = 1         | N = 3 | N = 10 | N = infinity |
|--------------|---------------|-------|--------|--------------|
| SI           | <b>16.54%</b> | 7.35% | 1.15%  | 0.00%        |
| SSI          | <b>10.22%</b> | 3.81% | 0.27%  | 0.00%        |
| Mixed-robust | <b>11.22%</b> | 3.99% | 0.31%  | 0.00%        |

N is the retry budget after the first failed attempt. N = infinity retries until commit, so visible errors are zero by construction.
